

2020 Eagle Hill Natural History Science Seminars . . .  
. . . on the coast of eastern Maine

## GRASSES OF THE GREATER NORTHEAST: IDENTIFICATION AND ECOLOGY

Dennis Magee

July 19 – July 25, 2020

The information presented in this course will include key distinguishing features for each of 10 tribes and upwards of 60 or so common and representative genera within those tribes. Dried plant material and dissecting microscope exhibits will be used to teach key identification features for each taxon. The first day will be spent in lecture and lab teaching necessary background material and identification concepts. On days 2 through 4 each morning will begin with a lecture on the taxa to be covered that day followed by examination of specimens. After lunch a field trip will be taken to develop field recognition skills followed by keying collected specimens back in the lab. The final day will be spent summarizing the course material, answering questions, and in the field, assisting participants in practical application.

### about the instructor

**Dennis Magee** (hmagee48@gmail.com) is the author or principal author of *Freshwater Wetlands: A Guide to Common Indicator Plants of the Northeast*, *Flora of the Northeast* (First and Second Editions), and *Grasses of the Northeast*. He has taught survey courses on Graminoides for the past 30 years throughout the Northeast.
